Retorio

Hiring Team

Application: Working Student, AI Engineer Agentic Systems

Dear Hiring Team,

I am writing to apply for the Working Student AI Engineer Agentic Systems role at Retorio. I am currently in the second semester of my M.Sc. in Data Science and Analytics at SRH University of Applied Sciences Heidelberg and available for 20 hours per week immediately.

My most directly relevant project is a fully local multi agent RAG system I built using LangGraph and Ollama. The system routes each query through a LanguageAgent for language detection, a retriever combining BM25 and dense vector search over Pinecone, a generator on Mistral 7B, and a separate JudgeAgent on Qwen2.5 14B that scores answers across five quality dimensions in JSON mode. The judge runs on a different model from the generator specifically to eliminate self preference bias. I also built an EvalAgent that computes five retrieval metrics and four generation metrics per language, so every run produces a structured quality report rather than a manual check. All inference runs locally. This architecture is close to the kind of agentic pipeline Retorio is building for its AI coaching product, and I would be glad to bring that experience directly into the team.

Beyond the RAG project, I spent six months at eRay GmbH as a Data Scientist building a recursive time series forecasting pipeline in Python from raw sensor data through CatBoost MultiQuantile models to an orchestrator with ecological validity checks. That project taught me how to move from a research prototype to a system that runs reliably on a schedule and produces outputs a domain expert can actually trust.

I would be very happy to talk through how my experience fits what the Retorio team is building.

Kind regards,

Rahul Rawat
