PROFILE

Master of Science Data Science student at SRH Heidelberg with practical experience in data preparation, statistical analysis and visualisation. I have cleaned and integrated messy multi source datasets, run correlation and statistical modelling to extract clear findings, and built interactive dashboards that turn raw data into decisions. I work with Python, PySpark, SQL and cloud tooling, and I am looking for a working student position in data science and analytics where I can apply theory to real data projects, which is exactly what this role offers.

EDUCATION

M.Sc. Data Science and Analytics, SRH University of Applied Sciences Heidelberg

Apr 2025 to Present

B.Sc. Computer Science, GL Bajaj Institute of Technology and Management

2019 to 2023

EXPERIENCE

eRay GmbH

Data Scientist · Oct 2025 to Mar 2026

- Built an end to end recursive time series pipeline forecasting four water quality indicators, chlorophyll a, turbidity, pH and dissolved oxygen, over a six month academic and industry collaboration.
- Ran statistical benchmarking across six models, Ridge, Gradient Boosting, LightGBM, XGBoost, CatBoost and Prophet, and used CatBoost multi quantile regression to deliver asymmetric 80 percent prediction intervals.
- Reconstructed missing winter readings with MICE imputation, a clear example of careful data preparation and cleaning on incomplete real world data.
- Wrapped the pipeline in an orchestrator with gate checks that halts on failed imputation rather than letting bad data cascade.

PERSONAL PROJECTS

Economic Impact Analysis of Global Climate Events: Python, Pandas, scikit learn, Random Forest, Matplotlib, Seaborn

- Ran an end to end analysis transforming raw global event datasets into structured insights for resource allocation and risk assessment.
- Performed advanced data preparation and cleansing, handling outliers, imputation and normalisation to build a high quality data foundation.
- Developed Random Forest models and correlation analysis to link disaster duration to financial impact, then communicated the statistical findings to non technical stakeholders through clear visual reports.

Real Time Flight Tracking Data Pipeline: Python, PySpark, BigQuery, dbt, Airflow, GCP, Tableau

- Collected live flight positions every 30 seconds and enriched each record against airport, aircraft and weather data from four sources, cleaning the raw data with PySpark on Google Cloud.
- Shaped the data into analysis ready tables and surfaced findings in Tableau with Python statistics through TabPy, showing air traffic dropped 4.4 times in heavy rain.
- Worked across relational tables and cloud storage, the same blend of SQL, Python and cloud technologies this role values.

Fast Food Nutritional Analyzer and Meal Simulator: Tableau, calculated fields, data storytelling

- Built an interactive two page Tableau dashboard with a dynamic meal cart that totals calories, fat and protein in real time from user selections.
- Authored complex calculated fields and parameter driven analytics to flag deceptive high fat items and switch views by user goal.
- Designed a two tier layout with a colour blind safe palette to reduce time to insight for the reader.

RESEARCH AND THESIS

Bachelor Thesis, Diabetes Prediction Using Machine Learning: Python, scikit learn, Pandas, Seaborn

- Built a full end to end pipeline comparing six classifiers on a clinical dataset of 768 records with 10 fold cross validation and per model confusion matrices.
- Caught biologically impossible zero values the original authors had overlooked, then applied IQR based outlier removal and proper imputation.
- Chose ROC AUC over accuracy as the headline metric for a 65 to 35 imbalanced dataset, avoiding a misleadingly rosy accuracy figure.
- Wrote up the findings as an IEEE style paper including an honest section on limitations.

LANGUAGES

- English: fluent, professional working proficiency
- German: B1, in progress
