Application for Werkstudent, Data Science and Machine Learning

Dear Hiring Team,

Your role works machine learning use cases such as predictive maintenance and anomaly detection on real time data from a central IoT platform, and that is precisely the kind of pipeline I have already built. I created a real time data pipeline that polls live positions every 30 seconds, enriches each record against four sources, cleans it with PySpark on Google Cloud and refreshes automatically every 15 minutes through Apache Airflow. Working with streaming, sensor style data from raw analysis through to a usable model is exactly what I enjoy.

Anomaly detection and time series modelling are central to my recent work. In my industry collaboration with eRay GmbH I built a recursive time series forecasting pipeline and engineered velocity and ecological bounds that flag physically implausible readings, the same logic that underpins detecting real faults versus noise on process data. In another project I built a machine learning classifier that detects and corrects problematic patterns in a decision process, backed by unit tests at full branch coverage so the code is production minded. I work with Python, scikit learn, gradient boosting libraries and SQL.

Muhr und Bender appeals to me because the work has direct impact on the efficiency of your plants, turning analyses into real improvements on the shop floor rather than staying theoretical. I am available as a working student alongside my Master in Data Science studies. I am fluent in English and my German is at B1 and improving.

I would welcome the chance to discuss how I can support your team. Thank you for considering my application.

Yours sincerely,
Rahul Rawat
