nexmart
Werkstudent, Data Engineering
Stuttgart

Dear nexmart Data Platform Team,

I am applying for the Werkstudent Data Engineering position on your Data Platform team. As a Data Science Master's student at SRH Heidelberg, I have already built a distributed web scraping pipeline from the ground up, orchestrating a Hadoop cluster with Docker Swarm and writing a Selenium and BeautifulSoup based scraper that handles dynamic, paginated e commerce pages, work that lines up closely with the web scraping pipelines this role is built around.

Your posting highlights building and testing data ingestion pipelines and documenting results for colleagues outside the team. In my Hadoop project I engineered a parser that handles missing data and decodes sponsored click tracking URLs into clean product links, then ingested the results into HDFS and ran redundancy tests across all three data nodes before extracting the processed data into SQL Server for analysis.

I bring the same pipeline mindset from a second project, a real time flight tracking system that polls a live API every 30 seconds, enriches each record against four separate data sources, and runs on Apache Airflow so the batch and real time layers refresh automatically. I am confident working in Python and SQL, comfortable with Git based collaboration, and used to working independently within a team that communicates mainly in English.

I am available as a Werkstudent for up to 20 hours a week and could start working with your team soon. I would welcome the opportunity to discuss the role further.

Kind regards,
Rahul Rawat
